

CLAIMS:

1. A plasma etching method comprising:  
forming a polymer comprising carbon and a halogen over at least  
some internal surfaces of a plasma etch chamber; and  
after forming the polymer, plasma etching using a gas effective to  
etch polymer from chamber internal surfaces; the gas having a hydrogen  
component effective to form a gaseous hydrogen halide from halogen  
liberated from the polymer.
2. The plasma etching method of claim 1 wherein the halogen  
is selected from the group consisting of fluorine, chlorine and mixtures  
thereof.
3. The plasma etching method of claim 1 wherein the halogen  
comprises fluorine.
4. The plasma etching method of claim 1 wherein the gas also  
comprises an oxygen component.
5. The plasma etching method of claim 1 wherein the gas also  
comprises  $O_2$ .
6. The plasma etching method of claim 1 wherein the hydrogen  
component comprises  $NH_3$ .

1  
2 7. The plasma etching method of claim 1 wherein the hydrogen  
3 component comprises  $H_2$ .

4 8. The plasma etching method of claim 1 wherein the hydrogen  
5 component comprises forming gas consisting essentially of  $N_2$  at about  
6 96% or greater and  $H_2$  at about 4% or less, by volume.

7  
8 9. The plasma etching method of claim 1 wherein the hydrogen  
9 component comprises  $CH_4$ .

10  
11 *Sub 10* 10. A plasma etching method comprising:  
12 forming a polymer comprising carbon and a halogen over at least  
13 some internal surfaces of a plasma etch chamber; and  
14 after forming the polymer, plasma etching using a gas effective to  
15 etch polymer from chamber internal surfaces; the gas comprising a  
16 carbon compound effective to getter the halogen from the etched  
17 polymer.

18  
19 11. The plasma etching method of claim 10 wherein the  
20 gettering comprises forming a gaseous hydrogen halide from the etched  
21 halogen.  
22  
23  
24

1 12. The plasma etching method of claim 10 wherein the  
2 gettering comprises forming a gaseous  $\text{COA}_x$  compound, where A is the  
3 etched halogen.

4  
5 13. The plasma etching method of claim 10 wherein the carbon  
6 compound comprises a hydrocarbon.

7  
8 ~~14. The plasma etching method of claim 10 wherein the carbon  
9 compound comprises an aldehyde.~~

10  
11 ~~15. The plasma etching method of claim 10 wherein the carbon  
12 compound comprises a ketone.~~

13  
14 16. The plasma etching method of claim 10 wherein the carbon  
15 compound comprises a C-O bond.

16  
17 17. The plasma etching method of claim 10 wherein the carbon  
18 compound comprises CO.

19  
20 18. The plasma etching method of claim 10 wherein the carbon  
21 compound comprises CO formed from  $\text{CO}_2$  injected into the chamber.

22  
23 19. The plasma etching method of claim 10 wherein the halogen  
24 comprises fluorine.

20. The plasma etching method of claim 10 wherein the gas also comprises an oxygen component.

21. A plasma etching method comprising:  
positioning a semiconductor wafer on a wafer receiver within a plasma etch chamber;

first plasma etching material on the semiconductor wafer with a gas comprising carbon and a halogen, a polymer comprising carbon and the halogen forming over at least some internal surfaces of the plasma etch chamber during the first plasma etching; and

after the first plasma etching and with the wafer on the wafer receiver, second plasma etching using a gas effective to etch polymer from chamber internal surfaces and getter halogen liberated from the polymer to restrict further etching of the material on the semiconductor wafer during the second plasma etching.

22. The plasma etching method of claim 21 wherein the receiver is biased during the first plasma etching and provided at ground or floating potential during the second plasma etching.

23. The plasma etching method of claim 21 wherein the gas comprises hydrogen which combines with the halogen during the second plasma etching to form a gaseous hydrogen halide.

24. The plasma etching method of claim 21 wherein the second etching is conducted with a temperature of the receiver provided at from about  $-10^{\circ}\text{C}$  to about  $40^{\circ}\text{C}$  and at a chamber pressure of from about 30 mTorr to about 5 Torr.

25. The plasma etching method of claim 21 wherein the halogen comprises fluorine.

26. The plasma etching method of claim 21 wherein the gas comprises an oxygen component.

27. The plasma etching method of claim 21 wherein the gas comprises  $\text{NH}_3$ , with hydrogen from the  $\text{NH}_3$  combining with the halogen during the second plasma etching to form a gaseous hydrogen halide.

28. The plasma etching method of claim 21 wherein the gas comprises  $\text{H}_2$  which combines with the halogen during the second plasma etching to form a gaseous hydrogen halide.

29. The plasma etching method of claim 21 wherein the gas comprises  $\text{CH}_4$ , with hydrogen from the  $\text{CH}_4$  combining with the halogen during the second plasma etching to form a gaseous hydrogen halide.

1 30. The plasma etching method of claim 21 wherein the first  
2 and second plasma etchings are conducted at subatmospheric pressure,  
3 and the wafer remaining *in situ* on the receiver intermediate the first  
4 and second etchings, and maintaining the chamber at a subatmospheric  
5 pressure at all time intermediate the first and second plasma etchings.

6  
7 31. The plasma etching method of claim 21 wherein the  
8 gettering comprises forming a gaseous  $\text{COA}_x$  compound, where A is the  
9 etched halogen.

10  
11 32. The plasma etching method of claim 21 wherein the gas  
12 comprises a carbon compound effective for the gettering.

13  
14 33. The plasma etching method of claim 32 wherein the carbon  
15 compound comprises a hydrocarbon.

16  
17 34. The plasma etching method of claim 32 wherein the carbon  
18 compound comprises a C-O bond.

19  
20 35. The plasma etching method of claim 32 wherein the carbon  
21 compound comprises CO.

36. A plasma etching method comprising:  
positioning a semiconductor wafer on a wafer receiver within a plasma etch chamber, the semiconductor wafer having a photoresist layer formed thereon;

first plasma etching material on the semiconductor wafer through openings formed in the photoresist layer with a gas comprising carbon and a halogen, a polymer comprising carbon and the halogen forming over at least some internal surfaces of the plasma etch chamber during the first plasma etching; and

after the first plasma etching and with the wafer on the wafer receiver, second plasma etching using a gas having one or more components effective to etch photoresist from the substrate and polymer from chamber internal surfaces and getter halogen liberated from the polymer to restrict further etching of the material on the semiconductor wafer during the second plasma etching.

37. The plasma etching method of claim 36 one of the gas components comprises hydrogen which combines with the halogen during the second plasma etching to form a gaseous hydrogen halide.

38. The plasma etching method of claim 36 wherein one of the gas components comprises  $O_2$  and another is hydrogen atom containing.

1  
2  
3  
4  
5  
6  
39. The plasma etching method of claim 36 wherein one of the gas components comprises  $O_2$  and another is hydrogen atom containing, said one component and said another component being provided in the chamber during the second plasma etching at a volumetric ratio of the one to the another of at least 0.1:1.

7  
8  
9  
40. The plasma etching method of claim 36 wherein the halogen comprises fluorine.

10  
11  
12  
13  
41. The plasma etching method of claim 36 wherein one of the gas components comprises  $NH_3$ , with hydrogen from the  $NH_3$  combining with the halogen during the second plasma etching to form a gaseous hydrogen halide.

14  
15  
16  
17  
42. The plasma etching method of claim 36 wherein one of the gas components comprises  $H_2$  which combines with the halogen during the second plasma etching to form a gaseous hydrogen halide.

18  
19  
20  
21  
22  
23  
24  
43. The plasma etching method of claim 36 wherein one of the gas components comprises  $CH_4$ , with hydrogen from the  $CH_4$  combining with the halogen during the second plasma etching to form a gaseous hydrogen halide.

1 44. The plasma etching method of claim 36 wherein the first  
2 and second plasma etchings are conducted at subatmospheric pressure,  
3 and the wafer remaining *in situ* on the receiver intermediate the first  
4 and second etchings, and maintaining the chamber at a subatmospheric  
5 pressure at all time intermediate the first and second plasma etchings.  
6

7 45. The plasma etching method of claim 36 wherein the  
8 gettering comprises forming a gaseous  $\text{COA}_x$  compound, where A is the  
9 etched halogen.  
10

11 46. The plasma etching method of claim 36 wherein the gas  
12 comprises a carbon compound effective for the gettering.  
13  
14  
15  
16  
17  
18  
19  
20  
21  
22  
23  
24

47. A plasma etching method comprising:

positioning a semiconductor wafer on an electrostatic chuck within an inductively coupled plasma etch chamber, the semiconductor wafer having a photoresist layer formed on an insulative oxide layer, the photoresist layer having contact opening patterns formed therethrough;

first plasma etching contact openings within the insulative oxide on the semiconductor wafer through the contact opening patterns formed in the photoresist layer with a gas comprising carbon and fluorine, a polymer comprising carbon and fluorine forming over at least some internal surfaces of the plasma etch chamber during the first plasma etching; and

after the first plasma etching and with the wafer on the electrostatic chuck, providing the electrostatic chuck at ground or floating potential while second plasma etching using a gas comprising an oxygen component and a hydrogen component effective to etch photoresist from the substrate and polymer from chamber internal surfaces, and forming HF during the second plasma etching from fluorine liberated from the polymer to restrict widening of the contact openings formed in the insulative oxide resulting from further etching of the material on the semiconductor wafer during the second plasma etching.

48. The plasma etching method of claim 47 wherein the oxygen comprises O<sub>2</sub>.

49. The plasma etching method of claim 47 wherein the hydrogen component comprises  $\text{NH}_3$ .

50. The plasma etching method of claim 47 wherein the hydrogen component comprises  $\text{H}_2$ .

51. The plasma etching method of claim 47 wherein the hydrogen component comprises forming gas consisting essentially of  $\text{N}_2$  at about 96% or greater and  $\text{H}_2$  at about 4% or less, by volume.

52. The plasma etching method of claim 47 wherein the hydrogen component comprises  $\text{CH}_4$ .

53. The plasma etching method of claim 47 wherein the first and second plasma etchings are conducted at subatmospheric pressure, and the wafer remaining *in situ* on the electrostatic chuck intermediate the first and second etchings, and maintaining the chamber at a subatmospheric pressure at all time intermediate the first and second plasma etchings.

54. A plasma etching method comprising:

positioning a semiconductor wafer on an electrostatic chuck within an inductively coupled plasma etch chamber, the semiconductor wafer having a photoresist layer formed on an insulative oxide layer, the photoresist layer having contact opening patterns formed therethrough; first plasma etching contact openings within the insulative oxide on the semiconductor wafer through the contact opening patterns formed in the photoresist layer with a gas comprising carbon and fluorine, a polymer comprising carbon and fluorine forming over at least some internal surfaces of the plasma etch chamber during the first plasma etching; and

after the first plasma etching and with the wafer on the electrostatic chuck, providing the electrostatic chuck at ground or floating potential while second plasma etching using a gas comprising an oxygen component and a carbon component effective to etch photoresist from the substrate and polymer from chamber internal surfaces, and gettering fluorine liberated from the polymer during the second plasma etching with the carbon component to restrict widening of the contact openings formed in the insulative oxide resulting from further etching of the material on the semiconductor wafer during the second plasma etching.

1 55. The plasma etching method of claim 54 wherein the  
2 gettering comprises forming a gaseous hydrogen halide from the etched  
3 halogen.

4  
5 56. The plasma etching method of claim 54 wherein the  
6 gettering comprises forming a gaseous  $\text{COA}_x$  compound, where A is the  
7 etched halogen.

8  
9 57. The plasma etching method of claim 54 wherein the carbon  
10 compound comprises a C-O bond.
